COMMANDaggregate

Auditing (CA-AU)

Description COMMANDaggregate's Auditing (CA-AU) module provides for the reporting on any user adding, changing, or deleting records from the master files, including Customers, Projects, and Items, as well as all of the support files such as Plants, Trucks, Employees, etc. Auditing is also available in Orders, Tickets, and Invoice preparation for tracking changes to orders and tickets.

- Features**
- Can be enabled for every editor or for specific editors in the system. A profile editor allows the user to determine which files are to be audited and what changes are audited. The user can specify preferences for additions, changes, or deletions (or any combination of these) to be audited for any file.
 - Provides functions that report to the user the number of fields audited when an add, change, or delete takes place.
 - Provides a reporting mechanism which allows the user to report on the audits performed over a period of time. The report can be limited to specific files, users, or types of events. It displays the event, what type of event it was, when the event took place, who initiated the event, and optionally, the value of the data before and after the event.
 - Provides an audit file editor to allow the user to recall and examine individual events in the audit file.
 - Provides a purge routine to purge records from the audit file. This function allows the user to save records based on a specific file, user, or type of event.
-

Prerequisite ➤ **Order Entry and Ticketing (CA-OE)**

Module
