

COMMANDconcrete Auditing (CC-AU)

Description COMMANDconcrete's Auditing (CC-AU) module is a feature of COMMANDseries that tracks all database changes, providing reports for any user who adds, changes, or deletes records from the master files, including Customers, Projects, Items, etc., as well as all of the support files such as Plants, Trucks, Employees, etc. Auditing is also available in Orders, Tickets, and Invoice preparation for tracking changes to orders and tickets.

Features

- Can be enabled for every editor or for specific editors in the system. A profile editor lets you determine which files are to be audited as well as which changes are audited. You can specify preferences for additions, changes, or deletions (or any combination of these) to be audited for any file.
- Provides functions that report the number of fields audited when an add, change, or deletion takes place.
- Provides a reporting mechanism to report on the audits performed over a period of time. The report can be limited to specific files, users, or types of events. It displays the event, what type of event it was, when the event took place, who initiated the event, and optionally, the value of the data before and after the event.
- Provides an audit file editor to recall and examine individual events in the audit file.
- Provides a purge routine to purge records from the audit file. This function allows you to save records based on a specific file, user, or type of event.

Prerequisites - Order Entry and Ticketing (CC-OE)

Notes - none
